Buffalo Turbine Monsoon For Dust Suppression

Dust from demolition and recycling sites can create potential health hazards for workers and the surrounding neighborhood. Hazardous airborne dust, possibly containing lead or asbestos, is commonly generated when handling materials and throughout the recycling process in crushers, shredders, grinders, and bailers. With air quality a primary health and environmental concern, many government agencies and local municipalities enforce clean air regulations.

Wet mist suppression is one of the best methods for controlling and reducing demolition and recycling dust. By creating a wall of micron size atomized fluid droplets, fugitive airborne dust particles instantly bond to it, then become heavier and drop to the ground.

The Benefit of Owning a Buffalo Turbine Monsoon

The Buffalo Turbine Monsoon effectively controls dust using the wet mist suppression method at a fraction of the cost compared to spray nozzle tip machines. This is possible because a Buffalo Turbine Monsoon features the revolutionary industry first turbine driven Gyratory Atomizing Nozzle.

Available in several power source options and compact, versatile mounting configurations. Each monsoon features the same legendary Buffalo Turbine single stage blower utilized in the motor sports industry, turf care profession and deployed by the U.S. Military. The Buffalo Turbine Monsoon is your powerful, cost effective solution to dust control.

Buffalo Turbine has proudly manufactured mist sprayers since 1945. Made in the USA at an ISO 9001:2008 Certified facility.
